

Installing ABCD in Debian Linux

1. install Apache2 and PHP5 modules

```
apt-get install apache2 libapache2-mod-php5 libxml2-dev  
libapache2-mod-proxy-html libpng12-dev libjpeg62-dev zlib1g-dev libtidy-dev  
libxslt1-dev curl php5-dev php-pear libyaz-dev php5-gd php5-xmlrpc php5-xsl
```

A terminal window titled "Terminal" with a menu bar (File, Edit, View, Search, Terminal, Help). The terminal output shows the installation of Apache2 and PHP5 modules. It starts with "Creating config file /etc/php5/cli/php.ini with new version", followed by "update-alternatives: using /usr/bin/php5 to provide /usr/bin/php (php) in auto mode". Then it processes triggers for ureadahead and ufw. Next, it sets up apache2-mpm-prefork (2.2.22-6ubuntu2.1) and starts the web server. A message from apache2 states: "Could not reliably determine the server's fully qualified domain name, using 127.0.1.1 for ServerName". This is followed by a "[OK]" status. Then it sets up apache2 (2.2.22-6ubuntu2.1) and libapache2-mod-php5 (5.4.6-1ubuntu1). It then creates a config file for /etc/php5/apache2/php.ini and restarts the web server. Another message from apache2 states: "Could not reliably determine the server's fully qualified domain name, using 127.0.1.1 for ServerName". This is followed by "... waiting apache2: Could not reliably determine the server's fully qualified domain name, using 127.0.1.1 for ServerName" and another "[OK]" status. Finally, it processes triggers for libc-bin and shows "ldconfig deferred processing now taking place". The prompt at the bottom is "eds@eds-Mint14VM ~ \$".

```
Terminal
File Edit View Search Terminal Help

Creating config file /etc/php5/cli/php.ini with new version
update-alternatives: using /usr/bin/php5 to provide /usr/bin/php (php) in auto mode
Processing triggers for ureadahead ...
Processing triggers for ufw ...
Setting up apache2-mpm-prefork (2.2.22-6ubuntu2.1) ...
 * Starting web server apache2
apache2: Could not reliably determine the server's fully qualified domain name,
using 127.0.1.1 for ServerName
[ OK ]
Setting up apache2 (2.2.22-6ubuntu2.1) ...
Setting up libapache2-mod-php5 (5.4.6-1ubuntu1) ...

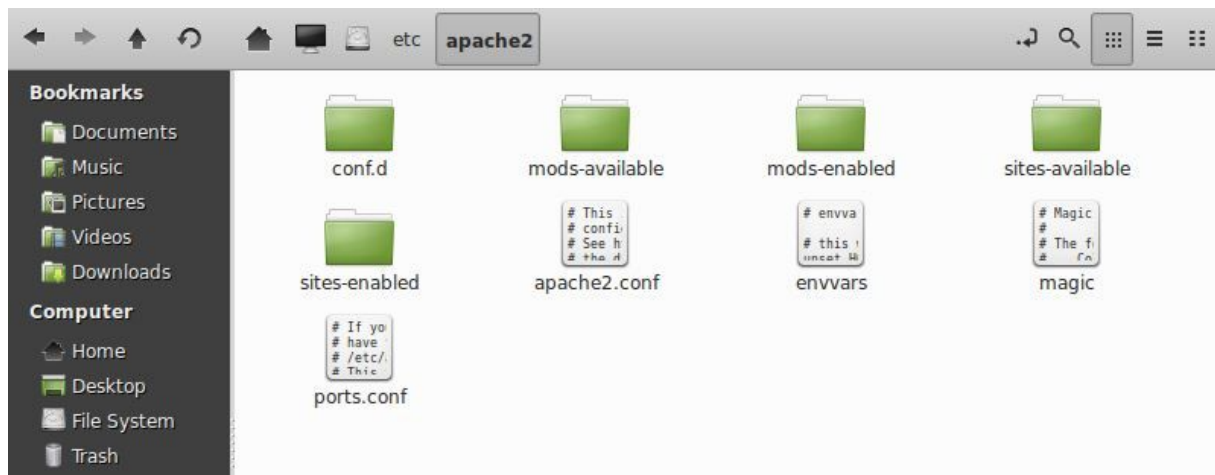

Creating config file /etc/php5/apache2/php.ini with new version
 * Restarting web server apache2
apache2: Could not reliably determine the server's fully qualified domain name,
using 127.0.1.1 for ServerName
... waiting apache2: Could not reliably determine the server's fully qualified
domain name, using 127.0.1.1 for ServerName
[ OK ]
Processing triggers for libc-bin ...
ldconfig deferred processing now taking place
eds@eds-Mint14VM ~ $
```

2. Download/copy ABCD-installation file, e.g. ABCD12t.tar.gz to your home folder and unpack it to create a folder /home/ABCD in a terminal with the command :

```
sudo tar -xvf ABCD12t.tar.gz .
```

3. copy the file 'abcd' in the Apache subfolder to the folder /etc/apache2/sites-available with the command :

```
sudo cp /home/ABCD/apache/abcd /etc/apache2/sites-available
```

4. create a symbolic link for this file to the sites-enabled folder with the commands :

```
cd /etc/apache2/sites-enabled  
sudo ln -s ../sites-available/abcf .]
```

5. change the port for the default website from 80 to e.g. 88 with the command :

```
sudo nano /etc/apache2/sites-available/default
```

and in that editor change the line

```
<VirtualHost *.80>
```

to

```
<VirtualHost *.88>
```

and press Ctrl-x, then press Enter to confirm saving the changes.

6. restart Apache2 with the command :

```
sudo /etc/init.d/apache2 restart
```

```

eds@eds-Mint14VM /etc/apache2/sites-enabled $ sudo /etc/init.d/apache2 restart
* Restarting web server apache2
apache2: Could not reliably determine the server's fully qualified domain name, using 127.0.1.1 for ServerName
... waiting apache2: Could not reliably determine the server's fully qualified domain name, using 127.0.1.1 for ServerName
[ OK ]
eds@eds-Mint14VM /etc/apache2/sites-enabled $

```

7. test your ABCD configuration now : open your browser (e,g, Firefox) and enter the URL 'localhost'

If everything was o.k., you will get the ABCD login screen.

ABCD 1.2 BETA TRANSITIONAL
2009 BIREME - Centro Latino Americano e do Caribe de Informação em Ciências da Saúde
<http://www.bireme.br>

BIREME • OPAS • OMS

Important notice : download the 64-bits version of the executables of CISIS to put in the cgi-bin folder !

Installation of YAZ :

Installation for UBUNTU / DEBIAN

tested for v.12.04 Server LTS but supposedly o.k. for all versions

Installing the Yaz PHP plugin and dependencies.

Debian/Ubuntu

```
apt-get install yaz libyaz4-dev php5-dev php-pear php5-xsl make
```

```
pecl install yaz
```

create : /etc/php5/conf.d/yaz.ini con el contenido extension=yaz.so

```
apache2ctl restart
```

You'll also need File_MARC:

```
pear install Structures_LinkedList
```

```
pear install File_MARC
```

You may need to specify versions if pear fails with 'beta channel' messages:

```
pear install Structures_LinkedList-0.2.0
```

```
pear install File_MARC-0.4.2
```

Fine-tuning

Depending on your local conditions, e.g. using 32-bits or 64-bits Linux, there are some more small things to do :

- if using 32-bits : rename /opt/ABCD/www/cgi-bin to cgi-bin64

and rename /opt/ABCD/www/cgi-bin32 to cgi-bin

(this will activate the 32-bits version of CISIS and set the 64-bits version aside).

EMPWEB

EmpWeb (ABCD Advanced Loans), if used (since there is already a built-in 'standard' Loans module in ABCD Central), needs quite some extra configuration actions :

- download and install the latest Java JDK, either OpenJDK or Sun-Java-JDK, e.g. with the command

```
apt-get install openjdk-7-jdk
```

and find out where it was installed exactly, e.g. with the command

```
find / -iname=javac
```

which will list all folders where the executable 'javac' is found. Note the one you have installed (as there might be others which were already installed before).

Put the path to the java-folder into empweb.sh in the folder /opt/ABCD/empweb where the JAVA_HOME and JAVA variables are defined, e.g. :

```
JAVA_HOME="/usr/lib/jvm/java-1.7.0-sun-1.7.0.16/bin"
```

```
JAVA="$JAVA_HOME/java"
```

but often (in the case of OpenJDK) the java-executable itself is not in the same folder as javac, in that case create a symbolic link to java in the folder where you found javac, or put the full correct path in the 2nd variable 'JAVA', e.g.

```
JAVA="/usr/lib/jvm/java-1.7.0-sun-17.0.16/jre/bin/java".
```

The first parameter \$JAVA_HOME points to the FOLDER where you found javac.

The second parameter \$JAVA points to the executable file 'java' itself.

- if using Empweb ABCD Advanced Loans in Linux 64-bits version : EmpWeb supposes the 'mx' executable to be in /cgi-bin/ as defined by Apache ScriptAlias. There is a problem when this executable itself is 64-bits due to incompatibilities with Java. The solution is to use the 32-bits version of CISIS in /opt/ABCD/www/cgi-bin, but since then iAH will have problems running in 64-bits, you have to copy the 64-bits version of wxis.exe into the cgi-bin folder and rename it (in order to not overwrite wxis.exe 32-bits version !) as 'wxis64.exe'.

Finally change the URL in index.php of the folder /opt/ABCD/www/htdocs/iah, to point to the 64-bits version of wxis.exe in the cgi-bin folder as follows :

```
header("Location: /cgi-bin/wxis64.exe/iah/scripts/?IsisScript=iah.xis&lang=" .  
$lang . "&base=" . $base);
```

- change coda.jspf to avoid the <io Request(...)

TO DO in deb package :

change EMPWEB_HOME and JETTY_HOME in
empweb/common/etc/init.d/empweb :OK

add reservation and cancelreservation in /engine/WEB-INF-conf/enginconf.xml :OK

change backup dir in /opt/ABCD/htdocs/central/bridge/config.inc.php :OK

change %EMPWEB_HOME to \$EMPWEB_HOME in empweb.sh :OK

gui\WEB_INF\web.xml : line 121 URL+path to user_photo ! also : line 77 of user.tag
in gui\WEB-INF\tags\display ??

change dr_path for users and biblo

in empweb.sh : set CISIS_HOME and MX variables (CISIS-Wrapper)
